Bearings - Loci and constructions - Edexcel - GCSE Maths Ships use bearings to navigate. A bearing is measured in degrees. A bearing: Since a bearing is measured clockwise, the bearing it flies at is  $360 - 20 = 340^\circ$  Bearings The above compass shows degree measurements from  $0^\circ$  to  $360^\circ$  in  $10^\circ$  intervals The true bearing to a point is the angle measured in degrees in a clockwise

Bearings Worksheets | Bearings Questions | Maths Made Easy First, we draw point A with a North line and measure an angle of  $104^\circ$  going anticlockwise from it (This is because  $360^\circ - 254^\circ = 106^\circ$  Understanding forward and back bearings - MapTools The bearing we end up with represents the angle between a line from Magnetic North to One technique is to do the math. You want the result to fall between  $0^\circ$  and  $360^\circ$ , so if the forward bearing is less than  $180^\circ$ , add  $180^\circ$  to it, and if it's
